The International Seismological Summary. 1947 January, February, March.

INTERNATIONAL GEODETIC AND GEOPHYSICAL UNION.
ASSOCIATION OF SEISMOLOGY.
FORMERLY THE BULLETIN OF
THE BRITISH ASSOCIATION SEISMOLOGY COMMITTEE.

The Director of the I.S.S. wishes to express his thanks to U.N.E.S.C.O. and H.M. Treasury for financial support, which has covered the cost and preparation of this volume.

The number constitutes the beginning of the eleventh volume of the International Seismological Summary in which travel times and Epicentral distances are calculated with reference to "Geocentric" latitudes of epicentres and observing stations. The travel-times used in making determinations are those contained in "Seismological Tables" by H. Jeffreys and K. E. Bullen, Brit. Ass. for Advancement of Science—London, 1950, and residual derived accordingly.

Distances are calculated from modified direction-cosines defined by :

$$\begin{aligned}A &= \cos \phi' \cos \lambda \\B &= \cos \phi' \sin \lambda \\C &= \sin \phi'\end{aligned}$$

λ being the east longitude from Greenwich and ϕ' the *geocentric* latitude whose relationship to the ordinary *geographic* latitude ϕ is :—

$$\tan \phi' = .99328 \tan \phi.$$

These formulae are used to determine direction-cosines of both epicentre and station, though the position is in every case referred to normal ϕ and λ .

The notation is that generally accepted. P and S stand for the times of onset of the direct longitudinal and transverse waves. Pg, Sg, P*, S* for short distances are used for times for these waves transmitted through the superficial "Granitic" and "Intermediate" layers respectively. Reflections of the direct waves at the earth's surface are denoted by PP, PS, PPP, SS . . . and at the outer surface of the central core by PCP, PCS . . .

The refracted longitudinal wave through the central core is known as K. Such waves as PKP, SKS, PKS, SKKS, are frequently recorded at great distances from the epicentre. All times are given as Greenwich Civil Time and are referred to the adopted T_0 as zero.

The scanned images of the bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and collected by SGA Storia Geofisica Ambiente (Bologna) on behalf of the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

2

The arrangement of the "Summary" consists of :—

- (1) Date and Time at Origin (T_0), calculated from the above-mentioned tables, together with the depth of focus where this is assumed not to be in the surface. The time calculated is that at which the P wave leaves the focus, not that when P arrives at the epicentre.
- (2) Epicentre constants :—

$$\begin{array}{lll} A = \cos \phi' \cos \lambda & D = \sin \lambda & G = \sin \phi' \cos \lambda \\ B = \cos \phi' \sin \lambda & E = -\cos \lambda & H = \sin \phi' \sin \lambda \\ C = \sin \phi' & & K = -\cos \phi' \end{array}$$

from which distances, Δ , and where necessary Azimuths, of stations with respect to the epicentre may be calculated by means of the formulae :—

$$\begin{aligned} \cos \Delta &= aA + bB + cC \\ 2 - 2 \cos \Delta &= (a - A)^2 + (b - B)^2 + (c - C)^2 \\ 2 + 2 \sin \Delta \sin Az. &= (a - D)^2 + (b - E)^2 + c^2 \\ 2 + 2 \sin \Delta \cos Az. &= (a - G)^2 + (b - H)^2 + (c - K)^2 \end{aligned}$$

a, b, c being related to the observing station in the same way as A, B, C are to the epicentre.

δ is defined as the nearest integer to $10^5(A^2 + B^2 + C^2 - 1)$ and may be used to compare distances calculated by the first two formulae above, whose equivalence depends on the assumption

$$A^2 + B^2 + C^2 = 1$$

h is the height, in kilometres, of the epicentre above the sphere of equal volume concentric with the earth and is given by

$$h = -3.549 + 10.788 \cos 2\phi$$

- (3) The tabular matter consisting of the station names arranged in order of epicentral distances, followed by this distance and the Azimuth measured round the epicentre from North through East. Other columns give the P phase and its residual, or PKP, in which the residual is shown in brackets []. The S phase or an associated phase follows with its residual. If SKS is entered here the residual is shown in [], and if SKKS in { }. Under "Supp" is placed the time of some other, preferably well recorded phase such as PS, SS, or, in the case of deep focus shocks, pP. The final column, L, records the onset, if known, of Rayleigh waves R, or of the horizontally polarised surface waves Q.
- (4) Readings for which space is not available in the tabular part, added at the foot.

The letters E, N, Z after a phase indicate that the reading was taken on an instrument recording East-West, North-South, or Vertical component of motion, though some stations have instruments oriented to record North-East or North-West components. Reflections near

The scanned images of the bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and collected by SGA Storia Geofisica Ambiente (Bologna) on behalf of the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

3

the epicentre take place, and in the case of deep focus earthquakes can be distinguished from the direct phases. These are distinguished as pP, sS, sP, pPP—the small p and s referring to the initial portion of the path towards the surface.

The letters a, k after a P or PKP phase stand for the terms "Anaseismic" and "Kataseismic," and indicate whether the first longitudinal motion was one away from the focus or towards it.

The epicentres for earthquakes with abnormal focal depth are calculated from travel times appropriate to them in the tables cited above. The depth to be assumed can be obtained from these tables when the observational data are plentiful, and the epicentre then determined in the usual way. When the data are scanty an indication of depth can be obtained from the evidence of the readings of certain individual stations.

The first quarter for 1947 contains 99 epicentres, 63 of which are repetitions from previous epicentres.

Cases of abnormal depth are noted below :—

Jan.	15d.	19h.	Undetermined shock.	Suggested Deep.

NOTES TO FEBRUARY 26d. 1h. 50m. 28s.

Additional readings:—

Bogota eSeSt = (14m.42s.), readings reduced by 1m.

Tucson iP = 6m.17s., i = 6m.26s. and 6m.49s.

Palomar iNZ = 7m.7s.

Long waves were also recorded at Bermuda, College, Fort de France, Salt Lake City, Butte, Harvard, Weston, Warsaw, Strasbourg, Paris, De Bilt, Uccle, Copenhagen, Cheb, and Istanbul.

Feb. 26d. 5h. 42m. 38s. Epicentre 39°.0N. 15°.2E. Depth of focus 0.030.
(as on 1943, Sept. 17d.).

$$A = + \cdot 7519, B = + \cdot 2043, C = + \cdot 6268; \quad \delta = - 3; \quad h = - 1; \\ D = + \cdot 262, E = - \cdot 965; \quad G = + \cdot 605, H = + \cdot 164, K = - \cdot 779.$$

Additional readings:—

Strasbourg e = 4m.30s. and 4m.53s.

Paris i = 3m.6s.

Warsaw eN = 8m.1s.

Feb. 26d. Readings also at 3h. (Andijan, Samarkand, near Obi-garm and Stalinabad), 4h. (Colombo, Calcutta, Hyderabad, Kodaikanal, Bombay, and New Delhi), 5h. (Riverview), 8h. (near Obi-garm, Stalinabad, and Andijan), 11h. (near Frunse), 13h. (near Andijan, Frunse, and Tchimkent), 14h. (Tinemaha, Mount Wilson, Tucson, Christchurch, and near Granada), 15h. (Riverview, Brisbane, and Jena), 16h. (near Lick), 20h. (near Branner), 21h. (Grand Coulee), 22h. (Tucson).

Feb. 27d. Readings at 1h. (Tinemaha, Riverside, and Tucson), 2h. (near Obi-garm), 8h. (Strasbourg), 10h. (near Balboa Heights), 15h. (near Andijan, Frunse, and Tchimkent), 16h. (Branner and near Lick), 17h. (Mount Wilson, Tinemaha, and Tucson), 18h. (near Grozny), 20h. (St. Louis, Tinemaha (2), Tucson (2), Prague, Cheb, Uccle, Strasbourg, Stuttgart (2), and near Malaga), 21h. (Lick, Strasbourg, Uccle, and Cheb).

Feb. 28d. Readings at 0h. (near Branner), 1h. (near Bogota), 3h. (near Bagota and near San Juan), 4h. (Riverside, Tinemaha, Tucson, Shasta Dam, Christchurch, Riverview, and Stuttgart), 6h. (St. Louis), 9h. (Riverside, Tinemaha, Tucson, La Paz, and near Montezuma), 10h. (Haiwee, Mount Wilson, Pasadena, Palomar, Riverside, Tinemaha, Tucson, Boulder City, Overton, Pierce Ferry, and Shasta Dam), 13h. (Strasbourg), 18h. (near Istanbul), 19h. (Copenhagen, Stuttgart, Haiwee, Mount Wilson, Riverside, Tinemaha, Tucson, Boulder City, Shasta Dam, Overton, Pierce Ferry, near Mizusawa, and near Andijan), 20h. (Istanbul), 21h. (Copenhagen, Strasbourg, Stuttgart, and Branner), 22h. (near Leninakan and near Mizusawa), 23h. (Tucson, Sotchi, near Piatigorsk (2), Grozny (2), Erevan, and Leninakan (2)).

The scanned images of the bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and collected by SGA Storia Geofisica Ambiente (Bologna) on behalf of the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

Additional readings :—

Stuttgart e = 5m.6s.

Prague e = 10m.57s.

Long waves were also recorded at Ivigtut and other European stations.

March 29d. Readings also at 1h. (near Algiers), 6h. (Riverside, Tinemaha, and Tucson), 7h. (near Reykjavik), 8h. (Rome), 9h. (Frunse, near Andijan and Tchimkent), 12h. (Uccle, Harvard and near Ottawa, Seven Falls, and Shawinigan Falls), 13h. (Riverview), 14h. (Harvard), 16h. (Brisbane), 17h. (Mount Wilson, Pasadena, Palomar, Riverside, Tinemaha, Tucson, Boulder City, Pierce Ferry, Shasta Dam, St. Louis and Stuttgart), 18h. (Mount Wilson (2), Pasadena, Palomar (2), Riverside (2), Tucson (2), Boulder City (2), Pierce Ferry (2), Shasta Dam, Florissant, St. Louis (2) and Stuttgart), 19h. (Strasbourg), 21h. (near Granada), 23h. (Samarkand, near Obi-garm and Stalinabad).

The scanned images of the bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and collected by SGA Storia Geofisica Ambiente (Bologna) on behalf of the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

1947

104

March 30d. 7h. 43m. 28s. Epicentre $40^{\circ} 8' N.$ $124^{\circ} 6' W.$ (as on 1945, Oct. 22d.).

Felt near the South West boundary of Humboldt County over an area of about 2000 sq. miles. Intensity VI recorded at Upper Mattole; V at Bridgeville, Eureka, Fortuna, and Holmes; IV at Arcata, Blue Lake, Cap. Mendocino, Carlotta, and Petrolia.

L. M. Murphy.

United States Earthquakes, 1947, Serial No. 730, Washington, 1950, p. 16. Epicentre near that adopted.

$$\begin{aligned} A &= -4324, B = -6268, C = +6482; \quad \delta = +1; \quad h = -2; \\ D &= -823, E = +568; \quad G = -368, H = -534, K = -762. \end{aligned}$$
