INSTALLATION AND EQUIPMENT OF THE SEISMOLOGICAL OBSERVATORY OF GEORGETOWN UNIVERSITY.

On the basis of a gift from Patrick H. O'Donnell, A.B. '92, A.M. '93, LL.B. '94, the foundation of the Georgetown University Seismological Observatory became possible. The original equipment consisted of an horizontal and vertical seismograph after Wiechert, each carrying a stationary mass of 80 kilos. These instruments were tentatively located in January, 1911, at the base of the South Tower of the Healy building. It was soon ascertained that this position was unfortunate because of the rocking of the tower, 212 ft. in height, under heavy wind conditions. A cave was promptly excavated beneath the quadrangle, measuring 12 ft. 4 in. in width, 30 ft. 10 in. in length and 11 ft. high. Care was taken to make this new home of the seismographs heat and damp proof. A new Wiechert horizontal seismograph of 200 kg. mass was purchased to take the place of the smaller one, which was thereupon loaned to the Croker Land Expedition for observations in the far North. The cave also houses the vertical seismograph after Wiechert, two Bosch-Omori pendulums of 25 kilos each and two conical pendulums after Mainka of 135 kg. mass. A concrete building, situated on observatory hill, at an altitude of 159 feet above sea level, shelters a Bosch-Omori photographic instrument with pendulums of 200 grams each. The time is automatically registered on these instruments by four contact clocks, noting minutes and hours. These clocks are corrected by wireless signals received from the United States Radiographic Station, Arlington, Va.

CONSTANTS

CONSTANTS OF THE STATION.

Latitude and longitude of the seismograph room:

$\phi = 38^\circ 54' 25''$ N. Lat.

$\lambda = 77^\circ 04' 24''$ W. from Greenwich.

TIME. All determinations are reduced to Greenwich mean civil time.

ALTITUDE, 42.4 meters above mean sea level.

GEOLOGY, subsoil of piers: decayed diorite.

CONSTANTS OF THE SEISMOGRAPHS.

BOSCH-OMORI TROMOMETERS (25 Kilos).

	Period.	Magnification.	Damping.
N-S Component.....	8.6	13.5	0
E-W Component.....	8.8	13.7	0

WIECHERT HORIZONTAL SEISMOGRAPH (200 Kilos).

	Period.	Magnification.	Damping.
N-S Component.....	5.2	143	2.6*
E-W Component.....	5.4	165	3.4

MAINKA CONICAL PENDULUM (135 Kilos).

	Period.	Magnification.	Damping.
N-S Component.....	5.4	70	0
E-W Component.....	4.0	93	0

WIECHERT VERTICAL SEISMOGRAPH (80 Kilos).

Period.	Magnification.	Damping.
3.0	80	0

*Dampers not in commission after June 30th.

SYMBOLS AND NOTATIONS.

1. *Character of the Earthquake.*

ROSSI-FOREL SCALE OF EARTHQUAKE INTENSITIES:

- I. *Microseismic shock:* recorded by a single seismograph or by seismographs of the same model, but not by several seismographs of different kinds; the shock felt by an experienced observer.
- II. *Extremely feeble shock:* recorded by several seismographs of different kinds; felt by a small number of persons at rest.
- III. *Very feeble shock:* felt by several persons at rest; strong enough for the direction or duration to be appreciable.
- IV. *Feeble shock:* felt by persons in motion; disturbances of movable objects, doors, windows; creaking of ceilings.
- V. *Shock of moderate intensity:* felt generally by everyone; disturbance of furniture, beds, etc., ringing of swinging bells.
- VI. *Fairly strong shock:* general awakening of those asleep; general ringing of house bells; oscillation of chandeliers; stopping of pendulum clocks; visible agitation of trees and shrubs; some startled persons leave their dwellings.
- VII. *Strong shock:* overthrow of movable objects; fall of plaster; ringing of church bells; general panic, without damage to buildings.
- VIII. *Very strong shock:* fall of chimneys, cracks in walls of buildings.
- IX. *Extremely strong shock:* partial or total destruction of some buildings.
- X. *Shock of extreme intensity:* great disaster, buildings ruined, disturbance of the strata, fissures in the ground, rock-falls from mountains.

<i>d</i> (terrae motus domesticus)	Local shock (origin nearby, perceptible at the station).
<i>v</i> (terrae motus vicinus)	Near shock (origin less than 1,000 kilometers distant).
<i>r</i> (terrae motus remotus)	Distant shock (origin from 1,000 to 5,000 kilometers distant).
<i>u</i> (terrae motus ultimus)	Very distant shock (origin more than 5,000 kilometers).

2. *Phases of the Seismogram.*

<i>P</i> (undae primae)	First phase, or first preliminary tremors.
<i>PR_n</i>	Waves n-times reflected at the earth's surface.
<i>S</i> (undae secundae)	Second phase, or second preliminary tremors.
<i>SR_n</i>	Waves n-times reflected at the earth's surface.
<i>PS</i>	Waves changed from longitudinal to transverse oscillation, or vice versa, through reflection at the earth's surface.
<i>L</i> (undae longae)	Long waves, chief phase, or principal part.
<i>M</i> (undae maximae)	Greatest motion in the chief phase.
<i>C</i> (cauda)	Tail or end portion.
<i>F</i> (finis)	End of discernible movement.

3. *Nature of the Motion.*

- i* (impetus) Sudden beginning of the motion.
- e* (emersio) Gradual beginning of the motion.
- T* (period) Time of one complete oscillation.
- A* amplitude of the motion, measured from the median line in millimeters. Instrumental trace.
- A_N E-W component of *A*.
- A_E N-S component of *A*.
- A_Z Vert. component of *A*.

REGISTRATION OF EARTHQUAKES AT THIS STATION

From January 1, 1916, to January 1, 1917.
